                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                        polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             98

Human transferase TRNSFS-6

19-JUN-2000

S S S E S E S

```
The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                     Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver
                                                                                                                                                                              Claim 27; SEQ ID NO 32901; 639pp + sequence listing; English.

The present invention relates to single exon nucleic acid propes for measuring human gene expression in a sample derived firsh human heart (see ABA21355-ABA41305). The present sequence is a protein encoded, by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing adding, staging, monitoring and prognessing diseases of the hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained. No electronic format directly from WIPO at the wipo int/pub/published_pit_sequences.

They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single, exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising qa conlection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene comprising of the exons in the issues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising one of 12011 sequences, mentioned in the specification, or encoded by the probes/open reading frames (ORF). The probes are used for gene carposopen reading frames (ORF). The probes are used for gene carposopen reading frames (ORF). The probes are used for gene carposopen reading frames (ORF). The probes are used for gene carposopen reading frames (ORF). The study of lung diseases corpusable manalysis, and for identifying exons in a gene, particularly cusing human lung derived mRNA and for the study of lung diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 27; SEQ ID No 33309; 634pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                Peptide #7984 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polypuclectides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen so polypuclectides, antibodies against human ovarian antigens, and the use of ovarian polypuclectides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast cancer, and disorders. Such conditions include ovarian cancer and breast cancer, and metastratic tumnours of ovarian or breast origin, reproductive system of isorders (e.g., infertinity, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HTV, toxoplasanosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and vaginitis), immune disorders (e.g., congenital and acquired the conformed infections antolmmune oophoritis, systemic lupus erythematosus), cardiovascular disorders, inclammatories, autoimmune oophoritis, systemic lupus erythematosus), crespiratory disorders (e.g., anaemia), cardiovascular disorders and uninary system disorders. Ovarian antigen polypeptides and conditions (e.g., anaemia), cardiovascular disorders and uninary system disorders. Ovarian antigen polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may be used as food additives or to prepare antibodies used unan ovarian antigen of the invention. The present consequence represents a human ovarian antigen of the invention of the present of the pritient of the sequence data for this patent did oot form part of the printed specification, but was obtained in electronic format directly from WIPO certification, but was obtained in electronic format directly from WIPO certification.

kinase-2 (DRNK-2) protein sequence: The DNKR-2 encoding DNA sequence
consists identified in Incyte Clone 37887 from the lung tissue cDNA
consists identified in Incyte Clone 37887 from the lung tissue cDNA
consists identified in Incyte Clone 37887 from the lung tissue cDNA
consists in Incyte Clone 37887 from the lung tissue cDNA
consists now far may may are deoxyganosine kinases, which catalyse
consists now far probably are deoxyganosine kinases, which catalyse
consists of a terminal phosphate from adenosine triphosphate (ATP)
consists of a terminal phosphate from adenosine triphosphate.
Consists of CGTP and its corresponding nucleoside triphosphate.
Consists are known to control the activity of certain oncogenic
concogenesis, suppression of the enzyme activity causes high ratios of
concogenesis, suppression of the enzyme activity causes high ratios of
concogenesis, suppression of the enzyme activity causes high ratios of
concogenesis, suppression of treated with the recombinant enzyme, or by
concogened strategies. Anti-sense constructs of the DNKR
concogened strategies and be used for inhibition of over-expression
                                                                                                                                                                                                                                       caused by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immune system; asthma; lymphocytic disease; brain; hepatic; lymphoma; inflammation; ischaemic shock; Alzheimer's disease; restenosis; AIDS; cognitive disorder; schizophrenia; prostate; obesity; osteoclast; thymus; osteoporosis; arthritis; testis; lung; thyroiditis; thyroid; digestion; endocrine; metabolism; regulation; malabsorption; gastritis; neoplasm.
                                                                                                                                                                                                                                                                                                                                                                           This sequence is the human-derived APS kinase/ATP.sulphurylase of the invention. The enzyme may be used to prepare 3'-phosphoadenosine 5'-phosphosulphate (PAPS) on a large scale.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                     New human-derived APS kinase/ATP sulfurylase gene - useful for
large scale preparation of 3'-phosphoadenosine 5'-phosphosulfate
(PAPS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  6.2%; Score 38; DB 20; Length 624; 100.0%; Pred.                                                                                                                                                                                                                                                                11-APR-1997
                                                                                                                                                                                                                                                                            11-APR-1997
                                                                                                                                                                                                                                                                                          11-APR-1997
                                                                                                                                                                                                                                  11-APR-1
                                                                                                                                                                                                                                                                                                                                     This sequence represents a secreted human protein encoded by the generate clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immosplobilin FC portion (e.g. AAX00602) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 8 novel genes and their fragments (nucleic red sequences: AAX00611-X00724; amino acid sequences AAX06041)

Which are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the presence of mutations in polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in (see AAX00611 for described uses)
                                                                                                                                                                                                                                                       New isolated human genes and the secreted polypeptides they encode useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

   This sequence represents a fragment of a secreted human protein encoded by the nucleic acid molecule designated Gene 14 (AAV59524).

The gene can be used to generate fusion proteins by linking to the gene to a buman immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW74711-W75026) which are useful for preventing, freating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions e.g. by protein or gene therapy. Also, pathological conditions by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human genes and the secreted polypeptide(s) they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                   produced by alternative splicing.
--- TISSUE SPECIFICITY: EXPRESSED IN CARTILAGE.
--- DISEASE: DEFECTS IN PAPSS2 ARE THE CAUSE OF SPONDYLOEPIMETAPHYSEAL DYSPLASIA, PAKISTANI TYPE (SEMD), AN AUTOSOWAL RECESSIVE DISEASE.
THIS FORM OF SEMD IS CHARACTERIZED BY A DYSPLASIA THAT IS PRIMARILY EPIPHYSEAL WITH ONLY MILD METAPHYSEAL ABNORMALITIES.
--- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE APS KINASE
          PATHWAY: BELONGS TO THE SULFATE ASSIMILATION PATHWAY THAT LEADS TO THE BIOSYNTHESIS OF CYSTEINE AND METHIONINE, AND TO THE SULFATION OF PROTEINS, CARBOHYDRATES, LIPIDS, DRUGS AND XENOBIOTICS.

ALTERNATIVE PRODUCTS: 2 isoforms; a (shown here) and b; are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          109 LFADAGLVCITSFISPFAKDRENARKIHESAGLPFFEIFVDAPLNICESRDVKGLYKRAR 168
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          phosphoadenylyisulfate.

PHENDAL BELONGS TO THE SULFATE ASSIMILATION PATHWAY THAT LEADS TO THE BILOSYWTHESIS OF CYSTEINE AND METHIONINE, AND TO THE SULFATION OF PROTEINS, CARBOHYDRATES, LIPIDS, DRUGS AND XENOBIOTICS.

TISSUE SPECIFICITY: EXPRESSED IN LIVER, CARTLIAGE, SKIN AND BRAIN. DISEASE: DEFECTS IN PAPSS2 ARE THE CAUGS OF BRACHYMORPHISM (BM), A AUTOSOMAL RECESSIVE DISEASE, WHICH IS CHARACTERIZED BY ABNORMAL
        KINASE ACTIVITY, WHICH MEDIAPES TWO STPES IN THE SULFURLASE AND APS AKINASE ACTIVITY, WHICH MEDIAPES TWO STPES IN THE SULFATE ACTIVATION PATHWAY. THE FIRST STEP IS THE TRANSFER OF A SULFATE GROUP TO ATP TO YIELD ADENOSINE 5'-PHOSPHOSULFATE (APS), AND THE SECOND STPE IS THE TRANSFER OF A PHOSPHATE GROUP FROM ATP TO APS YIELDING 3'-PHOSPHOADENTLYLSULFATE (PAPS: ACTIVATED SULFATE DONOR USED BY SULFOTRANSFERASE). IN MAMMALS, PAPS IS THE SOLE SOURCE OF SULFATE, AS APPEARS TO BE OMLY AN INTERMEDIATE IN THE SULFATE ACTIVATION PATHWAY. MAY HAVE A IMPORTANT ROLE IN SKELETOGENESIS DURING POSTNATAL GROWTH.
                                                                                                                                              CATALYTIC ACTIVITY: ATP + sulfate = diphosphate + adenylylsulfate.
CATALYTIC ACTIVITY: ATP + adenylylsulfate = ADP + 3'-
                                                                                                                                                                                                                                                                       HEPATIC DETOXIFICATION, BLEEDING TIMES AND POSTNATAL GROWTH, SUCH AS DOME-SHARED SYRULL, SHORT THICK TAIL, AND SHORTENED BUT NOT WIDENED LIMES. THE ANNORMAL POSTNATAL GROWTH HAS BEEN ATTRIBUTED TO UNDERSULFATION OF CARTILLAGE PROTEOGLYCANS.

IN MAMMALS, PAPS IS THE SOLE SOURCE OF SULFATE; APS APPEARS TO BE ONLY AN INTERMEDIATE IN THE SULFATE. ACTIVATION PATHWAY. ALSO INVOLVED IN THE BIOSYNTHESIS OF SULFATED. L-SELECTIN LIGANDS IN ENDOTHELIAL CELLS.

CATALYTIC ACTIVITY: ATP + sulfate = diphosphate + adenylylsulfate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE-9711554; Pubmed-9915785;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       phosphoadenylylsulfate.
PATHWAY: BELONGS TO THE SULFATE ASSIMILATION PATHWAY THAT LEADS TO THE BIOSYNTHESIS OF CYSTEINE AND METHIONINE, AND TO THE SULFATION
                                                                                                                                                                                                                                                                                                                                                                                                       "THE ISOLATION and characterization of cDNA encoding the mouse bifunctional ATP sulfurylase-adenosine 5'-phosphosulfate kinase.";
J. Biol. Chem. 270:29453-29459(1995).
I. Biol. Chem. 270:29453-19459(1995).
I. FUNCTION: BIFUNCTIONAL ENZYME WITH BOTH ATP SULFURYLASE AND APS KINASE ACTIVITY, WHICH MEDIATES TWO STEPS IN THE SULFATE ACTIVATION PATHWAY. THE FIRST STEP IS THE TRANSFER OF A SULFATE GROUP TO ATP TO YIELD ADENOSINE 5'-PHOSPHOAULFATE (APS), AND THE SECOND STEP IS THE TRANSFER OF A PHOSPHAPE GROUP FROM ATP TO APS YIELDING 3'-PHOSPHAPES OF A PHOSPHAPE GROUP FROM ATP TO APS YIELDING 3'-PHOSPHAPES OF A PHOSPHAPE GROUP FROM ATP TO APS SILFATE: APS APPEARS IN MAMMALS, PARS IS THE SOLES SOURCE OF SULFATE.

SULFATE, APS APPEARS TO BE ONLY AN INTERMEDIATE IN THE SULFATED IN SULFATED IN SULFATED IN THE BIOSYNTHESIS OF SULFATED IN SANDYMENT AND ANALYMENT AND ANALYMENT AND ANALYMENT ANALYM

"Cloning and characterisation of the APS kinase gene from
"Cloning and characterisation of the APS kinase gene from
"Seperalized (OCT-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CATALYZES THE SYNTHESIS OF ACTIVATED SULFATE.
-!- CATALYTIC ACTIVITY: ATP + adenylylsulfate - ADP + 3'-
phosphoadenylylsulfate - ADP + 3'-
-!- PATHWAY: SECOND STEP IN THE SULFATE ASSIMILATION PATHWAY THAT
LEADS TO THE BIOSYNTHESIS OF METHIONINE AND CYSTEINE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
